# A UNIQUE CONCEPT IN SPEED REDUCERS & GEARMOTORS

**SM-CYCLO cycloidal reducers and gearmotors are able to withstand shock loads to 500% of their ratings, and we warrant them for two full years.**

Sumitomo Machinery Corporation of America, a world leader in power transmission, has produced well over 6 million SM-CYCLO® Drive Speed Reducers and SM-CYCLO® Gearmotors.

Because of their unique advantages, exceptional performance and reliability, SM-CYCLO® Reducers and SM-CYCLO® Gearmotors are in use in a wide variety of industries worldwide. SM-CYCLO® Reducers and SM-CYCLO® Gearmotors have gained special recognition where severe working conditions prevail and where equipment breakdowns cannot be tolerated.

For over 25 years we have provided a nationwide sales, engineering, and service organization. Our national network of local representatives and distributors offers you comprehensive, fast and efficient service.

# FEATURES AND BENEFITS

## Highest Overload Capacity — 500% plus

The SM-CYCLO® speed reducer has the strength to withstand overloads that break the teeth of other reducers.

Here's why:

At least 2/3 of SM-CYCLO® speed reducer's teeth share the shock of overload, and each tooth is cycloidally shaped — it can't be sheared off.

Compare that to conventional reducers, where one or two teeth absorb the entire shock — teeth which have a defined shear point and can break off.

## Exceptional Life — 24 month warranty

Test SM-CYCLO® speed reducers show negligible wear after 50,000 hour life tests, and indications are future wear would be negligible. No one knows how long an SM-CYCLO® speed reducer, used correctly, will last. Virtually no wear failures have occurred in the over five million drives put into operation since 1939.

This remarkable record is due to SM-CYCLO® speed reducer's unique rolling action and the use of 52100 high-carbon chromium bearing steels, through-hardened and tempered to Rockwell C57-63 in all major torque-transmitting parts.

## High Efficiency Even at High Ratios

Torque transmitting parts roll, do not grind. There is no sliding friction, so output torque/input horsepower ratio approaches 95% efficiency in single reduction units.

## Capacity for Frequent Stop-Start and Severe Reversing

Flywheel (WR<sup>2</sup>) effect in the SM-CYCLO® speed reducer is reduced to a minimum, so that it responds quickly in these applications. The shear-free cycloidal teeth also make the unit ideal for those applications which quickly wear out competitive reducers.

## Compactness

SM-CYCLO® speed reducers are considerably smaller than conventional reducers, but they don't sacrifice efficiency in the higher ratios as other compacts must. This means you can use not only a smaller reducer, but a smaller motor too, because the high efficiency lets you obtain the same output torque you previously derived from a larger motor.

## No Thermal Factor Limitations

SM-CYCLO® speed reducer's smooth, almost frictionless operation all but eliminates the conventional limitations due to heat. In all sizes, the drive has a thermal rating that exceeds mechanical capacities.

### Smooth, Silent Operation

All parts of the speed reducer are completely symmetrized around the shafts, and the two cycloid discs which transmit the power are balanced in 180° opposition, for perfectly balanced centrifugal force. The result is smooth, vibrationless and quiet operation.

### Wide Range of Ratios, Input Power and Mountings

Single stage reductions from 6:1 to 119:1, double stage to 7,569:1; triple stage to 658,503:1; with practical ratios over 10 billion to 1.

Input horsepower from 1/16 to over 200 HP. Output torque to 521,000 IN-LBS.

A wide variety of horizontal and vertical mounts, with various adaptors, are available.

### Reliable, Maintenance-Free Service

SM-CYCLO® speed reducer's basic construction and simple principle of operation make it extremely reliable. Grease lubricated means no oil, no leaks, minimum maintenance and long trouble-free life.

### Concentric Shafts for Easy Mounting

Permits quick, easy, compact mounting, and direct, inline power transmission.

## HOW IT WORKS

### The reducer has only three major moving parts

1. The high speed input shaft with integrally mounted eccentric cam and roller assembly
2. The cycloid discs
3. The slow speed shaft assembly

### Operation

As the eccentric (high speed shaft) rotates, it rolls the cycloid discs around the internal circumference of the stationary ring gear.

The resulting action is similar to that of a wheel rolling along the inside of a ring. As the wheel (cycloid discs) travels in a clockwise path around the ring (ring gear), the wheel turns in a counter-clockwise direction around its own axis. In the SM-CYCLO®, the teeth of the cycloid discs engage successively with the pins of the fixed ring gear, thus providing a reverse rotation at a reduced speed. For each complete revolution of the high speed shaft, the cycloid discs are advanced a distance of one tooth in a reverse direction.

In general, there is one less tooth per cycloid disc than there are pins in the fixed ring gear, which results in reduction ratios being equal to the number of teeth in each disc. (NOTE: On some ratios, there are two less teeth per cycloid disc than there are pins in the fixed ring gear.)

The movement of cycloid disc is transmitted to the slow speed shaft by the projection of pins through the bores of the discs.

A two disc system is used to increase torque capacities and offer an exceptionally smooth vibrationless drive.

# BASIC INFORMATION AND RECOMMENDATIONS

## General

Selection of the SM-CYCLO® speed reducer should be based on actual horsepower and torque requirements at the output shaft. Contrary to conventional gear reducers, the SM-CYCLO® speed reducer has very high efficiencies over a wide range of reduction ratios. Proper selection frequently permits the use of reduced input power requirements without sacrificing torque at the output shaft.

## Drive Ratings

Standard SM-CYCLO® speed reducers are designed and built for long, maintenance-free, 10-hour daily service under conditions of uniform loads (equivalent to AGMA service factor 1.0). When your application involves more severe conditions, catalog ratings must be divided by the proper S.F., or the actual load must be multiplied by this factor.

## Service Factor

In general, gear drives are rated for a specific application by the use of Service Factors. Each application has its own conditions and operating requirements. There are three load classifications: uniform, moderate shock and heavy shock. These are further classified into duration of service per day and the prime mover. (See table below and load classification table on page 11.)

## Service Factors

Time of operation, frequency, and severity of shock must be determined in order to select the proper SM-CYCLO® reducer for a specific application. To assist in the selection process, AGMA has defined standard Service Factors. However, the Service Factors to be used for the selection of the SM-CYCLO® reducers differ from the standard Service Factors of AGMA as shown in the table.

The SM-CYCLO® Reducer Service Factors are smaller than those of the AGMA because AGMA Service Factors are determined on the basis of the strength of gears in the conventional helical or worm gear speed reducers.

The SM-CYCLO® reducer has higher overload capacity than conventional Helical or Worm gear speed reducers as a result of the tooth shape, greater number of teeth in contact, and the high material quality of the components.

## RECOMMENDED REDUCER SERVICE FACTORS

PRIME MOVER	DURATION SERVICE	LOAD CLASSIFICATIONS					
		UNIFORM		MODERATE SHOCK		HEAVY SHOCK	
		AGMA	SM-CYCLO reducer	AGMA	SM-CYCLO reducer	AGMA	SM-CYCLO reducer

	Up to 10 hrs. per day	1.50	<b>1.35</b>	1.75	<b>1.50</b>	2.25	<b>1.70</b>
	24 hrs. per day	1.75	<b>1.50</b>	2.00	<b>1.60</b>	2.50	<b>1.80</b>

## Excessive Overloads

SM-CYCLO® Speed Reducers provide 500% momentary intermittent shock load capacity and are warranted for 2 years from date of shipment. Refer to our standard terms and conditions for our complete warranty.

## Selection for Applications Involving Shock Loading

For applications involving frequent start-stop, braking or reversing, or quick starting of load having large inertia, consult factory for model selection or recommended modifications.

## Allowable Radial and Thrust Loads

The loads imposed on the slow speed shaft vary with the method of

connecting the shaft to the driven machine. Frequently, in addition to torsional forces, radial and thrust loads are applied to the slow speed shaft at the same time. For example, coupling connections normally involve torsional forces only. However, when power is transmitted through spur gears, belts, pulleys or chains, both torsional and radial forces may be applied to the slow speed shaft. When driving through helical or bevel gears, all three conditions (torsional, radial and thrust load) may be referred to the reducer shaft.

The slow speed shaft and bearings must have sufficient strength to withstand these loads, and it is,

therefore, necessary to determine the allowable limits for each condition.

## Load Centering

The radial load capacities are calculated with the load concentrated at the midpoint of the slow speed shaft extension. Radial load capacities decrease if the center of the load is moved farther from the reducer and the values obtained from the charts must be adjusted accordingly.

## Shaft Connections

### *Pulley, sprocket or sheave connection*

—Mount any of the above as close to the unit housing as possible, never beyond the midpoint of the shaft projection, to avoid undue bearing load and shaft deflection. Never overtighten belts or chains. Careful and accurate installation is essential for best results and for trouble-free operation. Before installing, the shafts should be checked to make sure that they are parallel and level. Perfect alignment after mounting can be checked with a string or straight edge held against the sides of the sprocket or pulley base.

Couplings should be properly aligned to the limits specified by the manufacturer. On coupled speed reducers coupling alignment should be checked prior to initial startup.

### SQUARE AND PARALLEL

### CORRECT METHOD

### INCORRECT METHOD

### CORRECT

REDUCER WALL

### INCORRECT

REDUCER WALL

## Shaft Rotation

On single reduction SM-CYCLO® speed reducers, the slow speed shaft rotates in a reverse direction to that of the high speed shaft.

On double reduction units, both the high speed and the slow speed shaft rotate in the same direction.

## Input Speeds

In general terms, the standard input speeds of single reduction units are 1750 and 1165 RPM.

When non-standard input speeds are used, the horsepower and torque ratings will also vary.

## Thermal Capacity

The SM-CYCLO® speed reducer's smooth, almost frictionless operation all but eliminates the conventional limitations due to heat. In all sizes, SM-CYCLO® speed reducers have thermal ratings that exceed their mechanical capacity.

## Mounting Tips

Horizontal and vertical oil-lubricated units should be mounted in exact planes whenever possible. When they are mounted on inclined surfaces, minor modifications are necessary, since an inclined mounting could lower the oil to a level that will starve reduction parts and bearings. On the other hand, overfilling a unit with oil may cause leakage through the air vent, foaming and churning and consequently overheating. Any of the above could result in damage to the unit. In many cases we can provide grease lubrication to solve this problem.

## Warranty

Sumitomo warrants that its SM-CYCLO® Speed Reducers will deliver their continuous catalog ratings and up to 500% intermittent SHOCK LOAD CAPACITY, provided they are properly installed, maintained and operated within the limits of speed, torque or other load conditions under which they were sold. Sumitomo further states that SM-CYCLO® Speed Reducers are warranted to be free from defects in material or workmanship for a period of two years from the date of shipment. Sumitomo assumes no liability beyond product repair or replacement under this limited warranty.

For construction purposes, be sure to obtain certified dimension sheets or drawings. Although we take every precaution to include accurate data in our catalog, we cannot guarantee such accuracy. If performance guarantees are required, they should be obtained in writing from the factory. Full consideration will be given to such requests when complete details are given of the proposed installation.

## Installation

Be sure to install and operate SM-CYCLO® speed reducers in compliance with applicable local and national safety codes. Appropriate guards for rotating shafts should be used and are available from local stocks.

## Lubrication Information

With the exception of sizes 4125 and smaller, and some multiple reduction units that are grease lubricated, SM-CYCLO® speed reducers are oil lubricated as standard.

### Grease-Lubricated Units

All grease-lubricated units are grease packed when they leave our Factory and are ready to operate.

### NOTE:

Frame size: 4075 — 4125 Maintenance Free Type — These frame sizes (single reduction) in horizontal or vertical shaft type are filled with "SHELL ALVANIA #2 GREASE" before shipment from the factory and need no replacement for 20,000 operating hours or 4-5 years.

## Oil-Lubricated Units

All oil-lubricated units must be filled to the proper level with oil before operating. Be sure to use a lubricant that meets nameplate specifications. Please refer to our current Operating & Maintenance Manual for complete details.

### Recommended Lubricants for SM-CYCLO® Speed Reducers

Ambient Temp.	14°F~32°F (-10°C~0°C)	32°F~95°F (0°C~35°C)	95°F~122°F (35°C~50°C)
Viscosity @ 40C (104°F) cSt.	61.2 ~ 74.8	90 ~ 165	198 ~ 506
ISO Viscosity Grade	68	100 ~ 150	220 ~ 460
AGMA Viscosity Grade	2EP	3EP 4EP	5EP 7EP
Viscosity @ 100F (38C) SSU	284 ~ 347	417 ~ 765	916 ~ 2719
SAE Grade (Gear Oils)	80W	85W 90	90 140

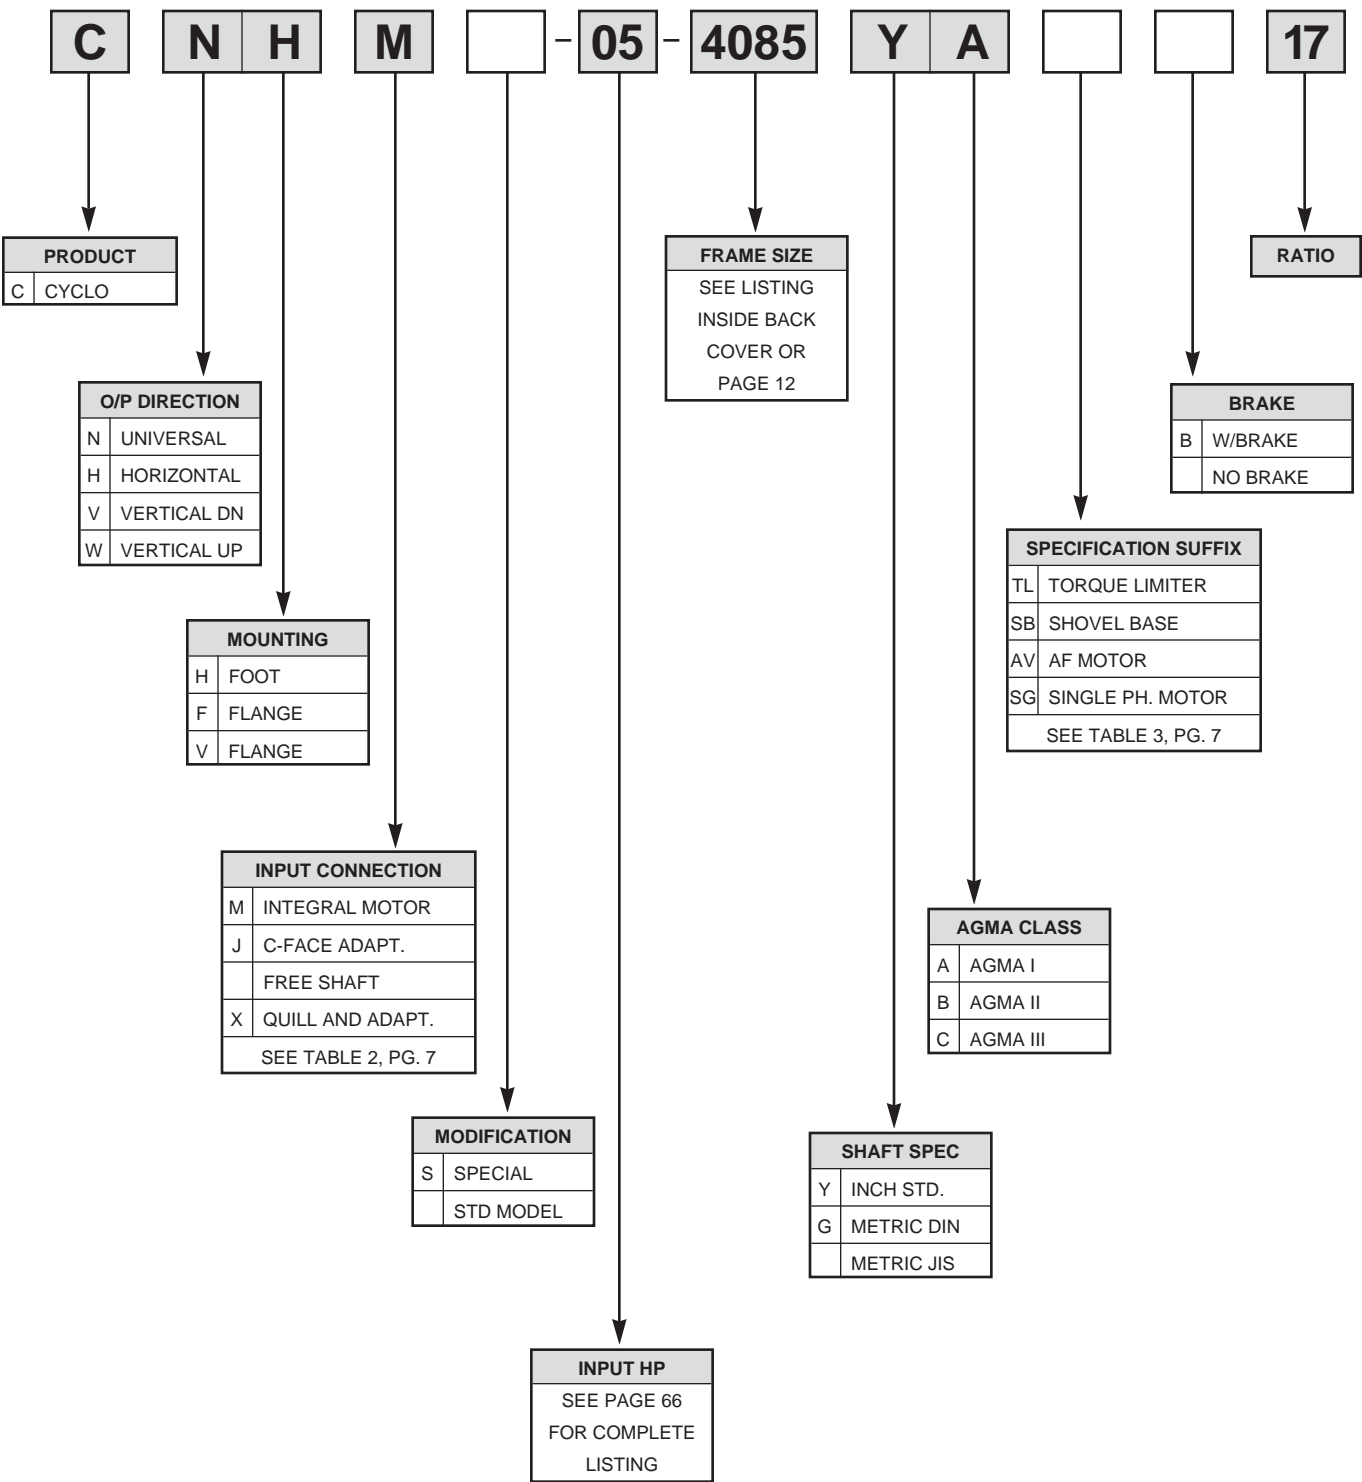

**NOTE:** Lubricant brand names are occasionally changed. Be sure to use proper lubricants shown on nameplate or lubrication tags.

# NOMENCLATURE AND MOUNTING POSITIONS

## NEW NOMENCLATURE

With the rapid expansion of industry requiring Sumitomo Products on a global basis, there is a need for a common worldwide standard for Sumitomo speed reducers and power transmission products. To help Sumitomo customers all over the industrial world,

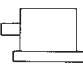

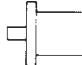

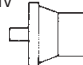

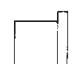

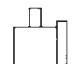

we will use a common descriptive nomenclature to identify our products.  
The 3000 Series Cyclo designation has been changed to a uniform worldwide designation of 4000 series. There have been no changes to the product itself other than description.

**Table 1. Standard Assemblies**

MOUNTING STYLE O/P SHAFT DIRECTION	FOOT H	FLANGE F	V FLANGE V (CYCLO ONLY)
HORIZONTAL H	HH  *	HF 	HV 
VERTICAL DOWN V	VH 	VF 	VV  *

**"V" Type Housing**

**"F" Type Housing**

# HOW TO SELECT FRAME SIZE AND MODEL

---

## Selection Procedure

The following information is necessary for proper selection of SM-CYCLO speed reducers:

- 1) Application
- 2) Hours of operation per day
- 3) Input speed of SM-CYCLO® speed reducer
- 4) Required slow speed shaft RPM of SM-CYCLO® speed reducer
- 5) Running power or torque required at input of driven machine
- 6) Input and output shaft connections
- 7) Mounting position and special modifications if any

With this information known, follow the procedure at right:

## Step 1

Refer to Basic Information and Recommendations pages 4 and 5.

## Step 2

Determine the Load Classification for the application from AGMA Load Classifications tables on page 11.

If the application is not listed refer to the Factory.

## Step 3

Establish the service factor for the application from "RECOMMENDED REDUCER SERVICE FACTORS" shown on page 4.

Multiply service factor by input horsepower (or output torque required) for frame size selection.

## Step 4

Select unit size for horsepower, input and output RPM. Refer to Rating tables on pages 12 through 27 and determine frame size.

## Step 5

Check overhung load when drive is not direct (i.e., coupled to the driven machine). When a chain, gear or belt is connected to the input or output shaft, calculate the overhung load by using the Allowable Overhung Load Data on pages 120 to 122.

## Step 6

Select type of SM-CYCLO® speed reducer by referring to "NOMENCLATURE" & "MOUNTING POSITIONS" on pages 8 and 9.

---

## Selection Example 1

Conditions:

- 1) Driven machine: apron feeder
- 2) Operation time: 24 hrs. per day
- 3) Motor speed: 1750 rpm
- 4) Required output speed: approx 30 rpm
- 5) Motor to be used: 10 HP frame 215TC
- 6) The reducer is to have a "C" Face coupled input.  
The output shaft will be coupled to the apron feeder.
- 7) A standard horizontal mounting is required.

Selection:

## Step 1

Review Basic Information and Recommendations on pages 4 and 5.

## Step 2

Load Classification from page 11 is: feeders; apron — moderate shock -M.

## Step 3

The SM-CYCLO service factor for moderate shock (M) and 24 hours per day operation is 1.35 from page 4. Selection HP is 10 HP motor times 1.35 S.F. equals 13.5 HP.

## Step 4

Ratio required is:

$$\frac{1750 \text{ input rpm}}{30 \text{ output rpm}} = 58:1$$

From Rating table on page 13, the closest ratio is 59:1 and unit frame size to suit 13.5 HP requirement is 4185.

## Step 5

Overhung load does not have to be considered because of coupling connections.

## Step 6

Complete model designator would be: HJ-4185 @ 59:1 ratio with "C" Adaptor to suit frame 215TC motor.

---

## Selection Example II

Conditions:

- 1) Driven machine: sludge collector
- 2) Operation time: 24 hours per day
- 3) Motor speed: 1750 rpm
- 4) Required output speed: approx 0.85 rpm
- 5) Required running torque: 50,000 lbs-in.
- 6) A 1 HP, 143TC motor is to be coupled to the input shaft. The output shaft will be coupled to the sludge collector shaft.
- 7) A vertical assembly with mounting base is required.

Selection:

## Step 1

Review Basic Information and Recommendations on pages 4 and 5.

## Step 2

Load classification from page 11 is: sludge collector - uniform loading -U.

## Step 3

The SM-CYCLO service factor for uniform loading (U) and 24 hours per day operation is 1.2, from page 4. Selection output torque is 50,000 lbs-in. times 1.2 SF equals 60,000 lbs-in.

## Step 4

Ratio required is:

$$\frac{1750 \text{ input rpm}}{0.85 \text{ output rpm}} = 2059:1$$

From Rating table on page 22, and 17 the closest ratio is 2065:1 and unit frame size to suit 60,000 lbs-in. output torque requirement is 4195DA.

## Step 5

Overhung load does not have to be considered because of coupling connections.

## Step 6

Complete model designation would be VJ-4195DA @ 2065:1 ratio with "C" adaptor to suit frame 143TC motor.

NOTES: MOTOR HP shown in the darker shaded areas is to overcome breakaway torque requirements in cold temperature or high inertia applications. It is recommended that a torque limiting device be used to protect the unit or driven machine.

\*With the exception of units marked, all ratio combinations are shown in the same orders as the frame size designations.

- NOTES: 1) For adaptor dimensions and weights on type HJ units refer to pages 29-31.  
2) Frame sizes 4275 not available in type HJ.  
3) For models 4175-4275, foot extension may interfere with sheave or sprocket drive on input side.  
4) Center height "D" for 4075, 4085 is less than half of "BD" (Frame 56C) Dimension.  
5) HJ 4105 - Motor 182TC combination consult factory, center height of 4105 is less than half of "BD" Dimension.

\* For tolerances refer to page 127.

\*\* Type H approximate.

† Approximate Weight includes reducer and adaptor only.

# TOP MOUNT

## TYPE HP

- Fabricated steel motor mount bolts directly to SM-CYCLO Reducer.
- Simple adjusting screws for belt tensioning.
- Motor mounts are furnished with pre-drilled holes for ease of motor assembly.
- Also available as side mount on type V (vertical) reducers. See page 45.

### NOTES:

1) For adaptor dimensions and weights on type VJ units refer to pg. 29-31.

\*For tolerances refer to page 127.

\*\*Type V approximate.

†Forced Lubrication: Certain ratios of Models 4195-4265 require dual lubrication systems. Certain ratios of Models 4255-4265 require external motor driven circulating lube system.

4235	15.25	18.25
4245	16.18	19.18
4255	18.75	21.75
4265	19.68	22.68
4275	23.00	26.00

- Fabricated steel motor mount bolts directly to SM-CYCLO Reducer
- Simple adjusting screws for belt tensioning
- Motor mounts are furnished with pre-drilled holes for ease of motor assembly
- Also available as top mount on type H (horizontal) reducers. See page 33.

\*Maximum may be increased up to 2" by use of shim blocks.  
 NOTE: Total V-Belt Drive Centers = 'A' Dimension listed above PLUS Motor 'D' Dimension.

†Because the SM-CYCLO reducer is so compact, in certain frame sizes the motor may extend below the SM-CYCLO mounting flange. Please consult factory for additional information.

# **SM-CYCLO® GEARMOTORS & BRAKEMOTORS**

# **“F” FRAME MOTORS**

- High strength extruded aluminum alloy motor frame.
- 50% stronger than die cast.
- 35% smaller.
- 35% lighter.
- Same power and efficiency of our “G” Frame.
- FB brakemotors now offer longer life, easier maintenance, higher cycling capacity and one touch release.
- Improved heat dissipation is excellent for inverter applications.

# ELECTRIC MOTORS & BRAKEMOTORS

Sumitomo Heavy Industries Electrical Division has been manufacturing various types of motors since 1913. The motor used with the SM-CYCLO® gearmotor has been manufactured since 1969 with well over 3 million having been shipped throughout the world.

## Motor and Brake Motor Design Features

- Totally enclosed fan cooled
- Squirrel cage rotor type
- NEMA Design B or A
- Designed for continuous duty
- Ambient temperatures -15° through 40°C (5°-104°F)
- Motor frames are made of Extruded Aluminum.
- Bearings are anti-friction type.
- Insulation NEMA Class B

### Voltages

Standard motor and brake coil voltages are 3 phase, 208/230/460V/575V 60 Hz.

- See page 120 for single phase motor characteristics.

### Optional Voltages:

- 190/380V at 50 Hz
- For other available voltages please consult factory.

## Special Motor Options

- Brake Coil Voltage: 200 VDC from rectifier. Standard Input Voltage is 208, 230 and 460. Additional voltages available. Please consult factory.
- Weatherproof: While our standard motor is TEFC and may be used outdoors, when used in severe environments, weather protection may be required.

- Insulation: NEMA Class F  
NEMA Class H
- Service Factor 1.15
- Dust Proof
- Chemical Duty
- Low-Temperature Modification
- Space Heater (115 or 230V)
- High Slip Motors
- Wash-Down
- High Humidity

- Wound-Rotor Motor (crane use motor)
- Star (Wye) — Delta Starting
- Thermostat or Thermistor Protection
- 6-Pole 1200 RPM Motor
- Two-Speed Motor — Constant Torque 1800/900 RPM
- External Shoe Brakes for Large Motors
- Cast Iron Frames

## HOW IT WORKS

### The reducer portion has only three major moving parts

1. The high speed input shaft with integrally mounted eccentric cam and roller assembly
2. The cycloid discs
3. The slow speed shaft assembly

### Operation

As the eccentric (high speed shaft) rotates, it rolls the cycloid discs around the internal circumference of the stationary ring gear.

The movement of cycloid disc is transmitted to the slow speed shaft by the projection of pins through the bores of the discs.

A two disc system is used to increase torque capacities and offer an exceptionally smooth vibrationless drive.

There is one less tooth per cycloid disc than there are pins in the fixed ring gear, which results in reduction ratios being equal to the number of teeth in each disc.

(NOTE: On some ratios, there are two less teeth per cycloid disc than there are pins in the fixed ring gear.)

The movement of cycloid disc is transmitted to the slow speed shaft by the projection of pins through the bores of the discs.

# STANDARD MOTOR CHARACTERISTICS

## Motor Characteristics

The SM-CYCLO® gearmotors full load ratings and amperage can be found below in table M-1. These ratings are based on the motors design values. If additional information is required please consult factory.

**Table M-1 — 230/460 Volt, Synchronous Speed 1800 rpm, 60 Hz, Continuous Duty, TEFC**

CMB-20	20 x 4	180 ~ 460	SB25F-3HS

\*Option

**NOTE:** Dual Voltage Rectifier P.N. 25FW-4FB is now standard for all FB brakes.

The voltage range is 190 ~ 460 V.

Single Voltage Rectifiers must be used with proper voltage brake coil.

# BRAKEMOTOR CHARACTERISTICS

The brakemotor on SM-CYCLO® gearmotors operates on a D.C. current supplied by a dual voltage rectifier mounted on the motor conduit box.

The standard brake input voltage is 208V OR 230V OR 460V at 60 Hz. (For other available voltages see page 57.)

Our standard brakemotor when used for outdoor installations must be protected with some type of covering. Such coverings are available from the factory, please inquire when ordering.

**Note:** While the brake torque can be field adjusted within a limited range, if you require larger or smaller brake torque than those listed, please advise the factory when ordering.

**Table B-1 Required Brake Response Action**

Condition	% Motor Torque Rating	Typical Application	Remarks
Rapid Brake Action	100%	Machine Tool Cutter and Table Transfer	
Frequent Start/Stop	100%	Conveyor Drive	Fast Brake Action May Be Required
Rapid Braking and Fail Safe	Over 150%	Crane, Hoist Winch, Gate, Lifting	Wiring Connection for Fast Brake Action Required
Rapid Deceleration of High Inertia	Over 150%	Centrifuge Drive Textile	

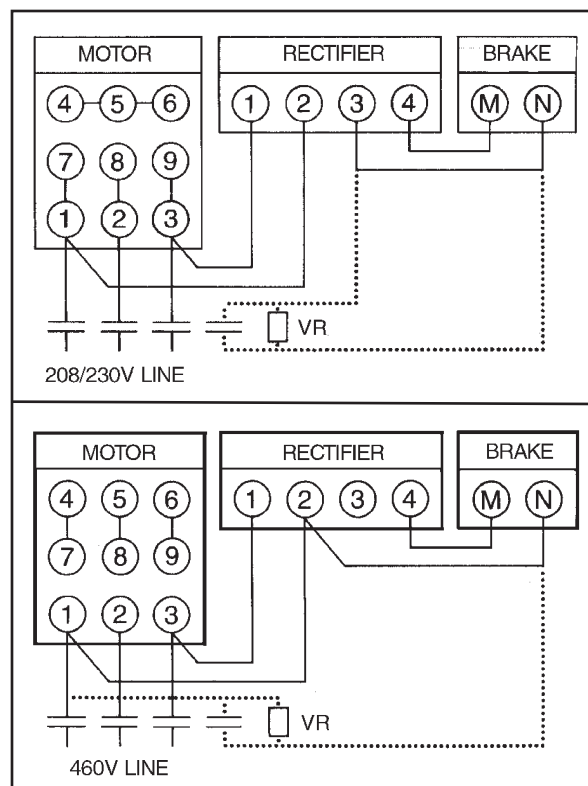

HP	TYPE		BRAKE Torque ft. lb.		Inertia WR <sup>2</sup> lb.ft <sup>2</sup>	Brake Delay Time (sec)		Coil Current AC Amperage

## Typical Brakemotor Wiring

Illustrated below is a typical brakemotor wiring schematic. Note the rectifier shown is supplied in the motor conduit box. Due to changes in design features, this diagram may not always agree with that on the motor. If different, the motor diagram found inside the conduit box cover is correct.

### Y Connected - (1½ HP and smaller)

### Delta Connected - (2 HP thru 15 HP)

- New dual voltage rectifier can be wired for 230V or 460V supply.
- Solid lines show the wiring connections for standard brake action.
- For fast brake action connect terminals as indicated by dotted lines. Add an additional contactor, and varistor VR from Table BV-1 below. Do not connect terminal N on brake coil to terminal 3 on rectifier for fast brake action. For 460V fast action braking do not connect terminal N on brake coil to terminal 2 on rectifier.

**Table BV-1: Varistors for Fast Braking Action**

OPERATING VOLTAGE		208 V / 230 V	460 V	575
Varistor Rated Voltage		AC260 ~ 300 V	AC510 V	AC604 V
Varistor Voltage		430 ~ 470 V	820 V	.1000 V
Varistor Rated Wattage	FB-01A, 02A, 05A	Over 0.2 W	Over 0.4 W	Over 0.4 W
	FB-1A	Over 0.4 W	Over 0.6 W	Over 0.6 W
	FB-2A, 3A, 5A, 8A	Over 0.6 W	Over 1.5 W	Over 1.5 W
	FB-10A, 15A	Over 1 W	Over 1.5 W	Over 1.5 W

\* Option

- Please refer to page 61 for rectifier data.

# ASSEMBLY OF BRAKEMOTORS

NOTE: See pages 6 through 8 for complete nomenclature information.

# HOW TO SELECT FRAME SIZE & MODEL

## Step 1

Refer to *Selection Procedure* at the bottom of this page.

## Step 2

Determine type of gearmotor required for your particular application: with brake or without brake horizontal or vertical. Mounting position must also be determined. Refer to page 60 for *Standard Assemblies*.

## Step 3

Determine the Load Classification for the Application from *AGMA Load Classifications* tables on pages 68 and 69. If the application is not listed refer to the Factory.

## Step 4

Select unit size for horsepower and output RPM. Refer to *Rating* tables on pages 70 through 107 and determine frame size.

## Step 5

Check overhung load when drive is not direct (i.e., coupled to the driven machine). When a chain, gear or belt driven machine is connected to a gearmotor output shaft, calculate the overhung load by using the *Allowable Overhung Load* tables, pages 124 through 126.

## Step 6

Refer to pages 108 through 119 and 122 through 123 for required outline dimensions.

The following is an example of proper gearmotor selection

## SELECT EXAMPLE

### Conditions:

1. Driven Machine — Belt Conveyor Drive
2. Duty Cycle — 24 hours a day with uniform loading
3. Input HP — 5 HP
4. Motor Specs — 3 phase, 60 Hertz 230/460 volts, totally enclosed
5. Output speed — 20 RPM
6. Mounting Position — Horizontal base-mounted reducer. 9" pitch diameter sprocket mounted on the output shaft. Center line of the load is 1.50" from the collar surface.

### Selection:

1. Load Classification is established as Class II from AGMA Load Classification Table on pages 64 and 65.
2. Class II Selection Table is cataloged on page 89. In the 5 HP column opposite 20 RPM output speed, Frame Size M4175-B is listed.
3. To check the overhung load capacity, refer to the rating table on pages 124 and 125. For Frame Size 4175 at 20 RPM output speed, the overhung load capacity is 5920 pounds.

Next, following the example on page 124 use the formula to determine the actual overhung load.

$$\text{Overhung Load} = \frac{126,000 \times \text{HP} \times \text{Cf} \times \text{Lf} \times \text{Sf}}{\text{D} \times \text{N}}$$

$$\frac{126,000 \times 5 \times 1.0 \times 0.96 \times 1.3}{9.0 \times 20} = 4368 \text{ lbs.}$$

Since the overhung load capacity of 5920 pounds is greater than the actual overhung load of 4368 pounds, this application is satisfactory.

4. Correct nomenclature for this unit would then be CHM5-4175YB @ 20 RPM output (refer to page 66).

## Selection Procedure

The following data are required to permit proper selection of the SM-CYCLO® gearmotor. Selection procedure steps are covered in detail above and on page 12 together with selection examples:

1. Application
2. Determination of Load Classification
3. Output RPM
4. Required HP
5. Mounting position and special modifications, if any.

## AGMA Load Classifications

In order to facilitate selection, SM-CYCLO® gearmotors are rated by AGMA load classifications. Values for most applications are listed on pages 68 and 69. For unlisted applications or for load conditions heavier than classified (such as 24-hour heavy shock loads) refer to the Factory.

## Service Factors

Time of operation and frequency and severity of shock must be determined in order to select the proper SM-CYCLO®

gearmotor for a specific application. To assist in the selection process, AGMA has defined three standard Service Factors. However, the Service Factors to be used for the selection of the SM-CYCLO® gearmotors differ from the standard Service Factors of AGMA as shown in the table at right.

The SM-CYCLO® gearmotor Service Factors are smaller than those of the AGMA because AGMA Service Factors

are determined on the basis of the strength of gears in the conventional helical or worm gear speed reducers.

The reducer portion of the SM-CYCLO® gearmotor has higher overload capacity than conventional helical or worm gear speed reducers as a result of the tooth shape, the greater number of teeth in contact, and the high material quality of the components.

## GEARMOTOR CLASSIFICATION TABLE

DURATION OF SERVICE	GEARMOTOR CLASS		
	UNIFORM LOAD	MODERATE SHOCK LOAD	HEAVY SHOCK LOAD
Intermittent 3 Hr. per day	Class I	Class I	Class II
Up to 10 Hr. per day	Class I	Class II	Class III
24 Hr. per day	Class II	Class III	—

**Class I** — SM-CYCLO® Drive S.F. 1.0 (AGMA Equiv. S.F. 1.0)

**Class II** — SM-CYCLO® Drive S.F. 1.3 (AGMA Equiv. S.F. 1.4)

**Class III** — SM-CYCLO® Drive S.F. 1.6 (AGMA Equiv. S.F. 2.0)

# AGMA LOAD CLASSIFICATIONS

**Class I** For steady loads not exceeding normal motor rating, 8 to 10 hours a day. Moderate shock loads where service is intermittent (SM-CYCLO Service Factor: 1.0; AGMA equivalent Service Factor: 1.0).

**Class II** For steady loads not exceeding normal motor rating and 24 hours a day service. Moderate shock loads for 8 hours

a day (SM-CYCLO Service Factor: 1.3; AGMA equivalent Service Factor: 1.4).

**Class III** For moderate shock loads for 24 hours a day. Heavy shock loads for 8 hours a day (SM-CYCLO Service Factor: 1.6; AGMA equivalent Service Factor: 2.0).

NOTES: 1) <sup>1</sup> For tolerances refer to page 127.

2) <sup>2</sup> Dimensions "C<sub>2</sub>, L<sub>2</sub>, WT<sub>2</sub>" are for BRAKEMOTORS.

3) MS dimension is clearance required for brake adjustment.

4) MT dimension is brake release lever.

5) If a 3-digit number is shown for horsepower, the last digit indicates the number of poles.

NOTES: 1) <sup>1</sup> For tolerances refer to page 127.

2) <sup>2</sup> Dimensions "C<sub>2</sub>, L<sub>2</sub>, WT<sub>2</sub>" are for BRAKEMOTORS.

3) MS dimension is clearance required for brake adjustment.

4) MT dimension is brake release lever.

5) If a 3 digit number is shown for horsepower, the last digit indicates the number of poles.

NOTES: 1) <sup>1</sup> For tolerances refer to page 127.

2) <sup>2</sup> Dimensions "C<sub>2</sub>, L<sub>2</sub>, WT<sub>2</sub>" are for BRAKEMOTORS.

3) MS dimension is clearance required for brake adjustment.

4) MT dimension is brake release lever.

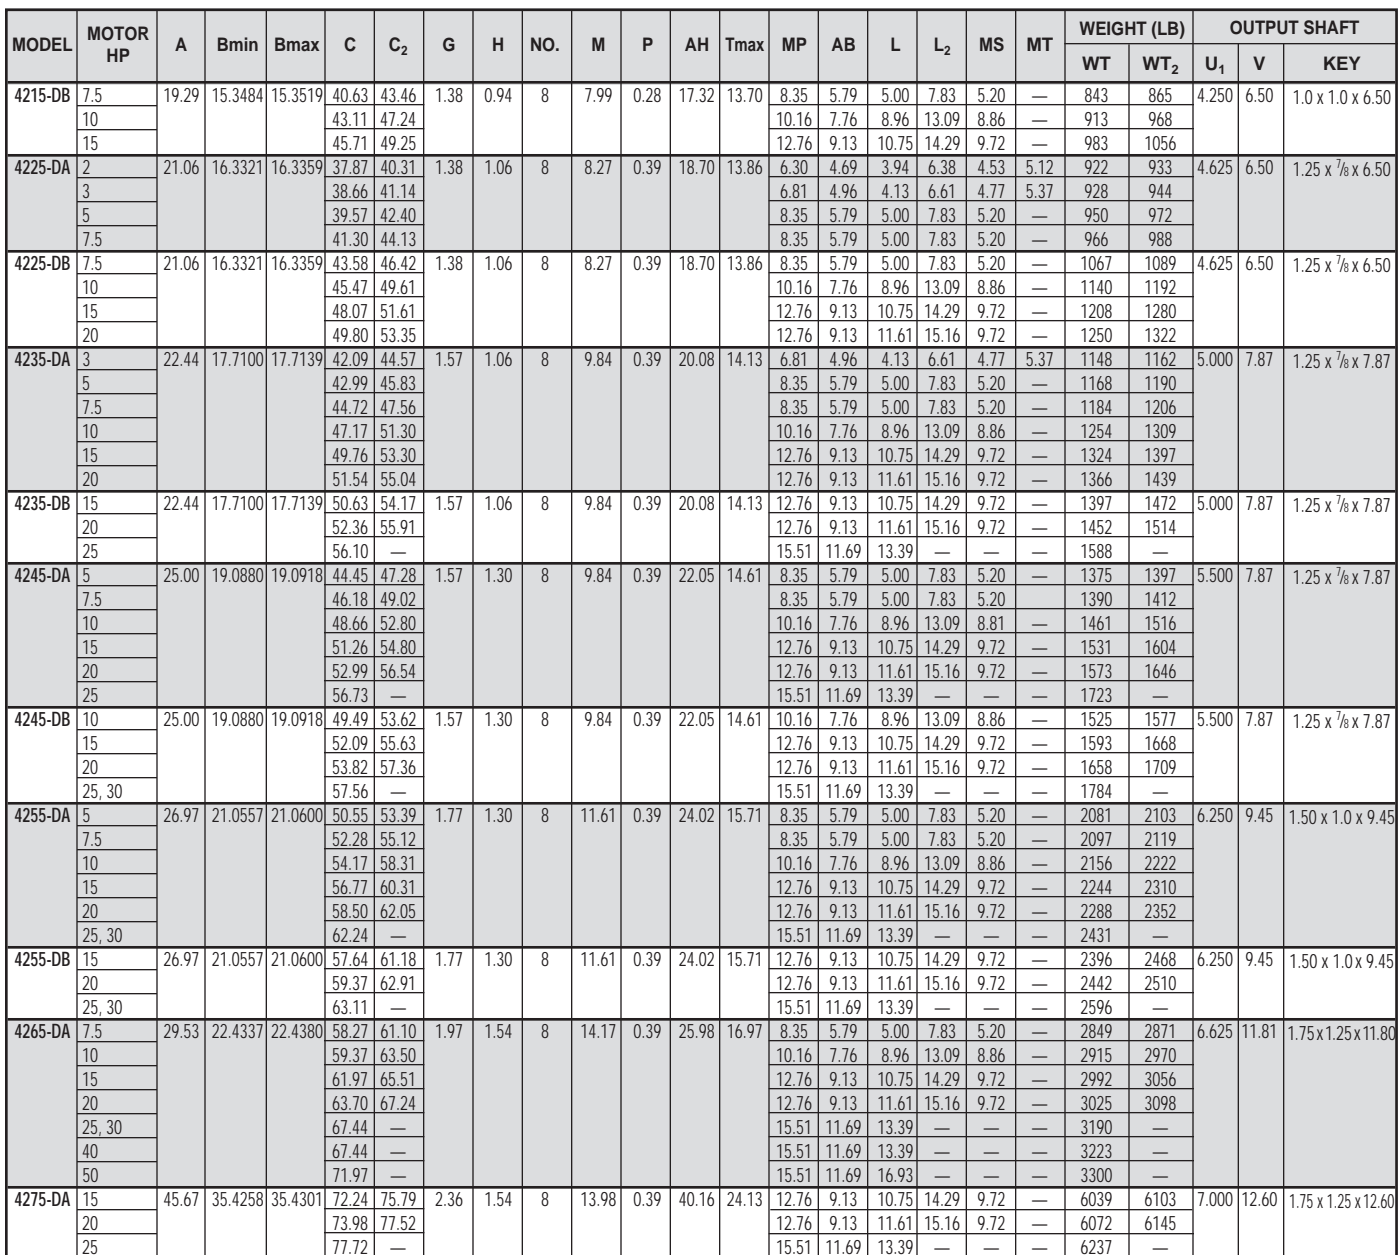

5) If a 3-digit number is shown for horsepower, the last digit indicates the number of poles.

4) MT dimension is brake release lever.

5) If a 3-digit number is shown for horsepower, the last digit indicates the number of poles.

3) MS dimension is clearance required for brake adjustment.

- NOTES:** 1) <sup>1</sup> For tolerances refer to page 127.  
2) <sup>2</sup> Dimensions "C<sub>2</sub>, L<sub>2</sub>, WT<sub>2</sub>" are for BRAKEMOTORS.  
3) MS dimension is clearance required for brake adjustment.  
4) MT dimension is brake release lever.  
5) If a 3-digit number is shown for horsepower, the last digit indicates the number of poles.

- NOTES:** 1) <sup>1</sup> For tolerances refer to page 127.  
2) <sup>2</sup> Dimensions "C<sub>2</sub>, L<sub>2</sub>, WT<sub>2</sub>" are for BRAKEMOTORS.  
3) MS dimension is clearance required for brake adjustment.  
4) MT dimension is brake release lever.  
5) If a 3-digit number is shown for horsepower, the last digit indicates the number of poles.

# SINGLE PHASE ELECTRIC MOTOR CHARACTERISTICS

## Specifications:

- Capacitor start
- Totally enclosed, fan cooled
- 4 pole, 60 cycle, 115/230 volts
- U.L. listed

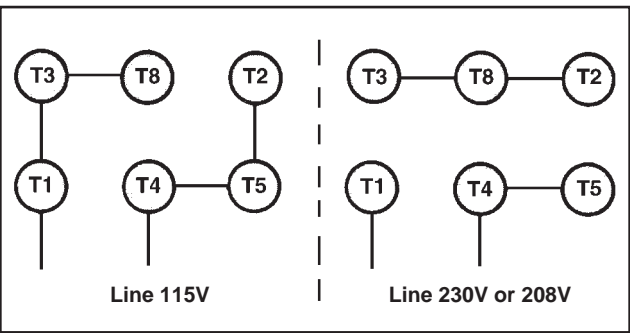

## Motor Characteristics

The SM-CYCLO gearmotor's full load ratings and amperage can be found below. These ratings are based on the motor's design value. If additional information is required please consult factory.

Motor		Frame	Full Load Amp.		Motor WR <sup>2</sup> lb-ft <sup>2</sup>
HP	RPM		115 V	230 V	
1/8	1750	S-71S	3.4	1.7	0.0356
1/4		S-71S	4.2	2.1	0.0356
1/3		S-71	6.5	3.2	0.0534
1/2		S-71	7.1	3.5	0.0534
3/4		S-90	10.8	5.4	0.1424
1		S-90	12.8	6.4	0.1424

# STANDARD WIRING DIAGRAM

Illustrated below are the wiring diagrams for our standard single phase motor. For additional information please refer to motor nameplate.

## Option:

- Brakemotor
- C.S.A. certified
- 6 pole motor

If these motors are required, please consult factory.

# SM-CYCLO REDUCER/GEARMOTORS

## COMMON DIMENSIONS AND SPECIFICATIONS

### ALLOWABLE OVERHUNG LOAD

When a sprocket, sheave, or gear is mounted on the slow speed shaft, or on the high speed shaft of a reducer, an overhung load is applied on the shaft. It is necessary to check whether the shafts of SM-CYCLO® speed reducers allow the overhung load.

### OVERHUNG LOAD CALCULATION

Calculate the overhung load with the formula below:

$$\text{Overhung Load} = \frac{126,000 \times \text{HP} \times \text{Cf} \times \text{Lf} \times \text{Sf}}{D \times N}$$

HP: Horsepower transmitted by shaft

Cf: Load connection factor (Select Cf from Table 1)

Lf: Load location factor (Select from Table 2)

Sf: Service factor (Determine from Service Factor Table on page 4)

D: Pitch dia of sprocket, etc.

N: Shaft speed (rpm)

**Table 1 — Load Connection Factor — Cf**

Type of Connection	Factor
General Purpose Chain	1.0
Machined Gear, Pinion or Synchronous Belts	1.25
V-Belt	1.5
Flat Belt	2.5

**EXAMPLE**

A uniformly loaded belt conveyor requiring 5 HP is to be driven 8 hrs/day by an SM-CYCLO® speed reducer, size 4135 ratio 29:1, 60 rpm output, using a 9.84" pitch dia, sprocket on the slow speed shaft. Center line of the load is 1.50" from the collar surface.

**PROCEDURE**

- 1) Calculate the overhung load  
With Cf = 1.0 from Table #1  
With Lf = 1.07 from Table #2  
With Sf = 1.07 from page 6

**OVERHUNG LOAD**

$$\frac{126,000 \times 5 \times 1.0 \times 1.07 \times 1.0}{9.84 \times 60} = 1142 \text{ lbs.}$$

- 2) Check the overhung load capacity of SM-CYCLO® speed reducer size 4135. Allow Overhung Load = 2140 lbs.

Since the allowable overhung load of the 4135 is larger than the calculated overhung load of 1142 lbs., the application is satisfactory.

# HIGH SPEED SHAFT ALLOWABLE OVERHUNG LOAD (REDUCER ONLY)

# **WATER TREATMENT MIXER OPTIONS**

# Proven Performers

**MIXERS**  
**AGITATORS**  
**CLARIFIERS**  
with TORQUE LIMITER

SM-CYCLO® *Mixer Drives, Agitator Drives and Clarifier Drives* are designed to endure the tests of time, hostile environments and shock overloads (500%). Rugged construction, smooth, rolling action of cycloid discs and over 5,000,000 installations worldwide have gained Sumitomo SM-CYCLO® speed reducers and gearmotors an unmatched reputation for proven performance and reliability.

Request free catalog & selection guide.

We offer a 24-month warranty, very competitive pricing and a national sales, engineering and service organization which provides comprehensive, fast and efficient service.

# TORQUE LIMITER EQUIPPED SM-CYCLO®

Torque Limiter Equipped SM-CYCLO DRIVES are offered as optional equipment for specific models of SM-CYCLO speed reducers and gearmotors. They are torque limiting devices which prevent damage to machinery from overloads and jams, thereby reducing costly downtime.

With torque limiter equipped SM-CYCLO speed reducers, when the reducer or gearmotor output torque exceeds a predetermined limit, a micro switch instantly breaks the motor circuit, protecting process equipment. These controls can be supplied for either one or two directions of rotation.

## FEATURES

### SAFE UNATTENDED OPERATION

Reliable Torque Limiter response to overload cuts motor power automatically, stopping the machine. This eliminates costly inspection and repair.

### COST AFFECTIVE MACHINE DESIGN

The torque setting on SM-CYCLO equipped with Torque Limiter is more accurate and reliable when compared with conventional Torque Limiters. Consequently, the use of a lower safety factor on auxiliary equipment may be considered, which will decrease the cost of the entire system.

### BI-DIRECTIONAL TORQUE SETTING

Normally, the Torque Limiter is set to limit torque relative to one direction of slow speed shaft rotation. However, the torque limiter can be set in both directions upon request.

### EASY SET POINT ADJUSTMENT

All calibration levels are factory set. No further adjustments are required. If recalibration is desired, simply rotate the adjusting bolt which changes restraint spring load and set point. Adjustment that can be made is within  $\pm 25\%$  of set torque.

### ENCLOSED STRUCTURE

Structure of the Torque Limiter is enclosed to prevent entrance of gas, dust and other environmental contaminants.

### COMBINATION WITH OTHER PROTECTIVE DEVICES

The Torque Limiter may be connected to another alarm system (i.e., buzzer and/or lamp) as an option to warn about power failure (see example wiring diagram).

### HIGH PRECISION

Basic component of the Torque Limiter is a high precision coil spring. Under load, the spring deflects in proportion to torque. Repeatability of the torque set point is  $\pm 5\%$  to  $\pm 10\%$ .

### POSITIVE MECHANICAL OPERATION

Reliable safety device at overload.

### INSTANTANEOUS RESPONSE TO OVERLOAD

Less time delay compared with electrical systems. Reaction to corresponding overload is much faster.

### SELECTED STARTING TORQUE

Torque set point can optionally be selected to withstand start-up torque by by-passing limit switch current.

# TORQUE LIMITER PRINCIPLE AND STRUCTURE

Output torque on Slow Speed Shaft (4) of Cyclo Drive is transmitted by means of a Cycloid Disc (3) to Ring Gear Housing (2), which is free to rotate in Fixed Frame (1). Under constant load, Lever (6) fitted in Ring Gear Housing (2) is held in a fixed position by preset force of Coil Spring (5). When load on Slow Speed Shaft (4) is increased, Ring Gear Housing (2) rotates in opposite direction to Slow Speed Shaft (4) causing Lever (6) to press against Coil Spring (5).

When output load exceeds preset value, Lever (6) actuates Limit Switch (7), instantaneously cutting motor power. After motor stops, and cause of overload is eliminated, force of Coil Spring (5) returns Lever (6) to its original neutral position.

Torque Limiter mounts on the first stage housing of double reduction units (example: on frame of 4130 for double reduction size 4195DB), on second stage housing of triple reduction units (example: on frame 4130 of triple reduction size 4195TD).

## EXTENDED USE OF TORQUE LIMITER

### TORQUE CAN BE CALIBRATED

A Torque Limiter with an indicator on which the load percentage is shown is also available.

1. Load percentage (% against the set torque) is shown on the indicator.
2. Range of indicator gauge is 60 to 100% of torque. Other indications available on request; consult factory.

# HOW TO READJUST PRESET TORQUE

1. All calibration levels are factory set. No further adjustments are required.
2. If recalibration is desired, simply rotate the adjusting bolt (2) per the scale (5).  
Preset torque is shown on top portion of the scale (5).  
 $T_1$  and  $T_2$  show the torque when the adjusting bolt (2) is rotated 150 degrees to C.W. or C.C.W.
3. Adjustment that can be made is within  $\pm 25\%$  of current preset torque.  
The adjusting bolt (2) can be rotated more than  $\pm 150$  degrees over the scale ( $T_1$  and  $T_2$ ) as long as the torque is within  $\pm 25\%$  of current preset torque.  
However the readjusted torque should be less than the rated output torque or Maximum preset torque in the selection table.

# TORQUE LIMITER SELECTION

1. SM-CYCLO TORQUE LIMITER is designed for 24-hour daily service under uniform or low fluctuating loads. For selection refer to the Tables 1 to 3 (Reduction Ratio 6 through 109,091:1). When the application involves frequent start-stop, heavy shock load, consult the factory.
2. "The preset torque" must be less than the rated output torque. However, the preset torque must be less than the number in bracket for the frame size with the bracket in Tables 1 to 3.
3. The selection table is based on 1750 rpm input. Consult the factory when input speed is not 1750 rpm.

**Table 1 (Single Reduction Reducers) Reduction Ratio 6:1 to 87:1 Input Speed 1750 rpm.**

RATED Output Torque (In-Lbs)	Reduction Ratio	6	11	17	29	35	43	59	87
	Output Speed (rpm)	292	159	103	60.3	50.0	40.7	29.7	20.1

39100	Frame Size	—	4195	4195	4195	4190	4195	4195	4195
	Motor HP		40	30, 40	20, 30	15, 20	15, 20	10, 15	10
	Maximum Preset Torque		13900	16100, 21400	18300, 27400	16500, 22100	20300, 27100	18600, 27900	[27500]

**NOTE:**

**1. Designation of figures indicated in each frame.**

**Example**

4135	→	Frame size of SM-CYCLO
5, 7½, 10	→	Standard input HP (input speed 1750 rpm)
1730, 2600, 3470	→	Each value shows the maximum output torque when the above motor is fully loaded.
		When there is no number, the preset torque is allowed up to the rated output torque shown in the left frame.
		The value in the bracket is the torque allowable on the output shaft especially for the reduction ratio and the frame size.

**2. Selection Example**

Given Ratio 59:1, Input Speed 1750 rpm, Preset Torque 5200 IN. LBS.

**Procedure**

- 1) Locate the model which satisfies the preset torque 5200 IN. LBS and the ratios 59:1 in the Table. At the cross of ratio 59:1 and Rated Output Torque 7640 IN. LBS, following data is found.

Frame Size 4160

Motor HP 3

Maximum Preset Torque 5580 IN. LBS

- 2) 5200 IN. LBS is less than the Maximum Preset Torque, therefore 3 HP is enough for required torque.

NOTE: 1. DESIGNATION OF FIGURES INDICATED IN EACH FRAME.

EXAMPLE

4190DB	→	Frame size of SM-CYCLO
7.5, 10	→	Standard input HP (input speed 1750 rpm)
25,400,	→	Each value shows the maximum output torque when the above motor is used.
[32,100]	→	[Above side value for the right side motor HP, lower side value for the left side motor HP]

The value in the bracket is the torque allowable on the output shaft especially for the reduction ratio and the frame size. When there is no number, the preset torque is allowed up to the rated output torque shown in the left and right frame.

## 2. SELECTION EXAMPLE

Given Ratio 12427:1, Input Speed 1750 rpm, Preset Torque 28,600 IN-LBS.

Procedure

\*Locate the model which satisfies the preset torque 28,600 IN-LBS and the ratio 12427:1 in the table.

At the cross of ratio 12427:1 and Rated Output Torque 31200 IN-LBS, following data is found.

Frame Size 4185TA

Motor HP 1/2 HP

## 2. SELECTION EXAMPLE

Given Ratio 12427:1, Input Speed 1750 rpm, Preset Torque 28,600 IN-LBS.

Procedure

\*Locate the model which satisfies the preset torque 28,600 IN-LBS and the ratio 12427:1 in the table.

At the cross of ratio 12427:1 and Rated Output Torque 31200 IN-LBS, following data is found.

Frame Size 4185TA

Motor HP 1/2 HP

### NOTES:

- Conduit box dimension (AB) is for weatherproof motors.  
Conduit box dimension (AB) of the standard motor is slightly less.
- NEMA C Face Adaptor available
- Horizontal Type available
- All dimensions in inches
- Shaft tolerance + 0.000  
- 0.001

## VERTICAL GEAR MOTOR/TYPE VM, TRIPLE REDUCTION

### SPECIFICATION

1. MOTOR - Totally enclosed fan cooled, 3 phase induction motor, NEMA CLASS B design.

#### AVAILABLE VOLTAGE

Standard voltage 230/460V, 60 Hz  
Optional voltage 575V, 60 Hz  
220/380V, 50 Hz

2. Lubrication: Grease

# CLARIFIER DRIVE LUBRICATION

## For Triple Reduction Cyclo Reducer (Grease Lubricated Unit)

### Lubrication for triple reduction Cyclo Reducer:

1. Lubrication method.....grease lubricated
2. Standard grease.....Shell Alvania #2  
(-5°F - 122°F)

### Maintenance

1. Grease replenishment and change interval

Replenishment	Less than 10 hrs. per day	Every 3 - 6 months
	10 - 24 hrs. per day	Every 500 - 1000 hours
Change	Speed reduction mechanism	Every 2 - 3 years
	Slow speed shaft bearings	Every 3 - 5 years

2. Grease replenishment and change procedure

#### a. Replenishment

- Remove the grease purge at the vertical case, and then replenish the grease through the grease fitting at the high speed end shield or flange of motor by using the grease gun.
- Replenish the grease while running in order for grease to be distributed well.
- Replenish grease to the reduction mechanism 1/3 to 1/2 of quantities for the first reduction stage (see Table 1).

#### b. Change

- When the unit is disassembled for overhauling, refill grease in quantities indicated in Table 1 or, alternatively, 80% of the space around reduction mechanism and slow speed shaft bearings of single reduction units and 50% around reduction mechanism of first, second and third stage of triple reduction units.

Apply grease liberally to the central part (i.e., around the eccentric bearings) of the mechanism. Apply grease to both the slow speed and high speed shaft bearings as you would do to ordinary bearings at time of re-assembly.

### NOTE:

If excessive grease is added, agitation heating of the grease will raise the operating temperature of the unit. Avoid excessive greasing; however, as the reverse case, when the grease is insufficient it will raise the operating temperature due to the breakdown of the lubrication films on the eccentric bearing.

**Table 1 - Quantities of Grease (Ounces)**

# SPECIAL BASE MOUNT SM-CYCLO DRIVE®

---

The 14V and 17V Series SM-CYCLO DRIVES are designed especially for applications such as agitator, mixer and reaction vessel drives in water treatment, chemical, pharmaceutical and food industries. The 17V Series is particularly suited for the drives of aerators. This series has a design that can be readily installed on tanks and/or vessels prepared by the users.

---

## FEATURES: BENEFITS

### 1. EASY INSTALLATION

In the basic design of this series the SM-CYCLO DRIVE slow speed side is directly connected with the special lantern (vertical base) for the mixer shaft.

All the SM-CYCLO DRIVE advantages of high efficiency, compact size, robust and long life, and low noise level are included in this series.

### 2. SIMPLE DESIGN

The electric motor, SM-CYCLO DRIVE, and the vertical base are coaxially arranged, making a total configuration that is simple and easily accessible.

### 3. SIMPLE SHAFT CONNECTION

The mixing operation can be started by simply connecting to the mixer shaft.

### 4. LOW MAINTENANCE

Radial and thrust bearings are grease lubricated for ease of maintenance.

---

## STANDARD SERIES

SM-CYCLO DRIVES with special base mount designed for mixer/agitator work are available in the two standard series as illustrated below:

### 14V

This series has a shorter vertical base than the 17V making it more suitable for applications where the distance to the mixer blade is relatively short or for thinner liquid mixing.

### 17V

The extension shaft and SM-CYCLO DRIVE slow speed shaft are rigidly connected. The extension shaft is supported by two bearings at the vertical base (lantern).

# CYCLO DRIVE® BENDING MOMENTS AND THRUST CAPACITIES

14V Specifications

MODEL	BENDING MOMENT (LB. FT.) <sub>1</sub>	THRUST LOAD CAPACITY (LBS.) <sub>2</sub>	BEARING SPAN (IN INCHES)

4180/5	2170	1400	17.72	1.28
4190/5	2820	1720	19.69	1.36

**NOTE:**

1. Bending Moment is at the mounting surface.
2. Both upward or downward thrust loads can be supported.

Consult factory for greater thrust capacities.

In double reduction models these loads are applicable only to the output portion of the speed reducer.

# OPERATING PRINCIPLES

The SM-CYCLO® speed reducer is fundamentally different in principle and mechanism from the conventional helical or worm gear speed reducers.

This unique speed reducer is an ingenious combination of the following two mechanisms:

- (1) A combination of a planet gear and a fixed internal sun gear. In the SM-CYCLO® speed reducer, the planet gear has cycloidal-shaped teeth and the sun gear has circular pin teeth. The number of teeth in the planet gear is one or two less than that of the sun gear.
- (2) A constant speed internal gearing mechanism.

See **Figure 1**.

In equation 1, below, P identifies the number of the planet gear teeth, S that of the sun gear,  $\omega_1$  the angular velocity of the crankshaft around the axis of the sun gear, and  $\omega_2$  the angular velocity of the planet gear around its own axis. The velocity ratio of  $\omega_2$  to  $\omega_1$  is then shown as follows:

$$\frac{\omega_2}{\omega_1} = 1 - \frac{S}{P} = -\frac{S-P}{P} \dots\dots\dots \text{Equation 1}$$

With S greater by one or two than P in this equation, the highest velocity ratio is obtainable.

That is, if  $S-P=1$  is applied to Equation 1, the velocity ratio may be calculated from the following equation:

$$\frac{\omega_2}{\omega_1} = -\frac{1}{P} \dots\dots\dots \text{Equation 2}$$

or if  $S-P=2$  is applied to Equation 1, the velocity ratio may be calculated from the following equation:

$$\frac{\omega_2}{\omega_1} = -\frac{2}{P} \dots\dots\dots \text{Equation 3}$$

As the crank shaft rotates at the angular velocity  $\omega_1$  around the axis of the sun gear, the planet gear rotates at the angular velocity  $-\frac{1\omega_1}{P}$  or  $-\frac{2\omega_1}{P}$

where P indicates the number of the teeth of the planet gear and the symbol '-' indicates that the rotation of the planet gear is in a reverse direction to that of the crank shaft.

In the SM-CYCLO® speed reducer, illustrated in **Figure 2**, circular teeth (pins) are adapted for the sun gear and epitrochoid curve teeth for the planet gear, thereby avoiding the tooth top interference.

The rotation of the planet gear around its own axis is taken out through a constant speed internal

**Figure 1. Principle of Internal Planetary Gearing**

**Figure 2. Epitrochoid Planet Gear – Circular (PIN) Tooth Sun Gear Combination**

**Figure 3. Constant Speed Internal Gearing**

**Figure 4. Combination of Plant – Sun Gears and Constant Speed Internal Gear**

gearing mechanism as shown in **Figure 3**.

In this mechanism shown in **Figure 4**, the pins of the slow speed shaft are evenly spaced on a circle which is concentric to the axis of the sun gear. The pins transmit the rotation of the planet gear by rolling internally on the circumference of the bores of each

planet gear or cycloid disc. The diameter of the bores minus the diameter of the slow speed shaft pins is equal to twice the eccentricity value of the crank shaft (eccentric). This mechanism smoothly transmits only the rotation of the planet gear around its own axis to the slow speed shaft.

---
